Why do stars shine?

- Primordial hydrogen cloud
- Hydrogen cloud collapse - gravity
- Nuclear Fusion
 - $H+H \rightarrow D$
 - $D+H \rightarrow He$
- Heat of fusion

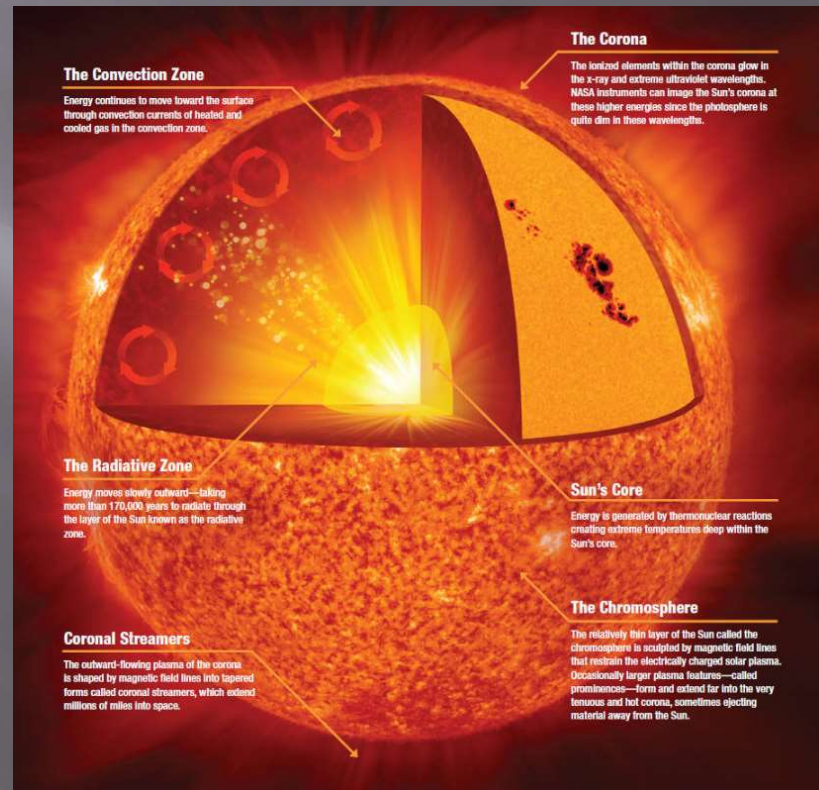

Forces in the Sun

- ▣ Gravity - compressive
- ▣ Hot core - expansive
 - ▣ Radiative zone
 - ▣ Convective zone
 - ▣ Corona
 - ▣ Chromosphere
 - ▣ Coronal streamers

Crab Nebula – Hubble Image

- ▣ Supernova 1054
Chinese
astronomers
- ▣ Center – neutron
pulsar
 - Diameter ~12 mi
 - 32 rps
 - 1.4 solar masses

Crab Nebula

Crab Nebula

Radio

Infrared

Optical

Ultraviolet

X-ray

Outline

- ▣ LIGO – Laser Interferometer Gravitational-Wave Observatory
- ▣ Blue-Blood moon

Neutron Star (1.3-2.5 Solar Masses)

Neutron Star Structure

Densities ρ_0 saturation nuclear matter density, where nucleons begin to touch.

Robert Schulze <https://commons.wikimedia.org/w/index.php?curid=11363893>

August 17, 2017 Kilonova

- Merger of two Neutron stars
 - Emit gamma ray bursts
 - Produce elements heavier than Iron
 - “R-process” nuclei
- Less bright than type II supernova (0.1-0.02)
 - Type I supernova – binary red dwarf or white dwarf and another star
 - Type II Supernova – massive star collapse

NOVA & Type I Supernova
Red Giant & Neutron Star

NASA Simulation (Merger of two neutron stars)

Neutron Star Merger

Gravitational Shock Wave Gamma Ray Burst

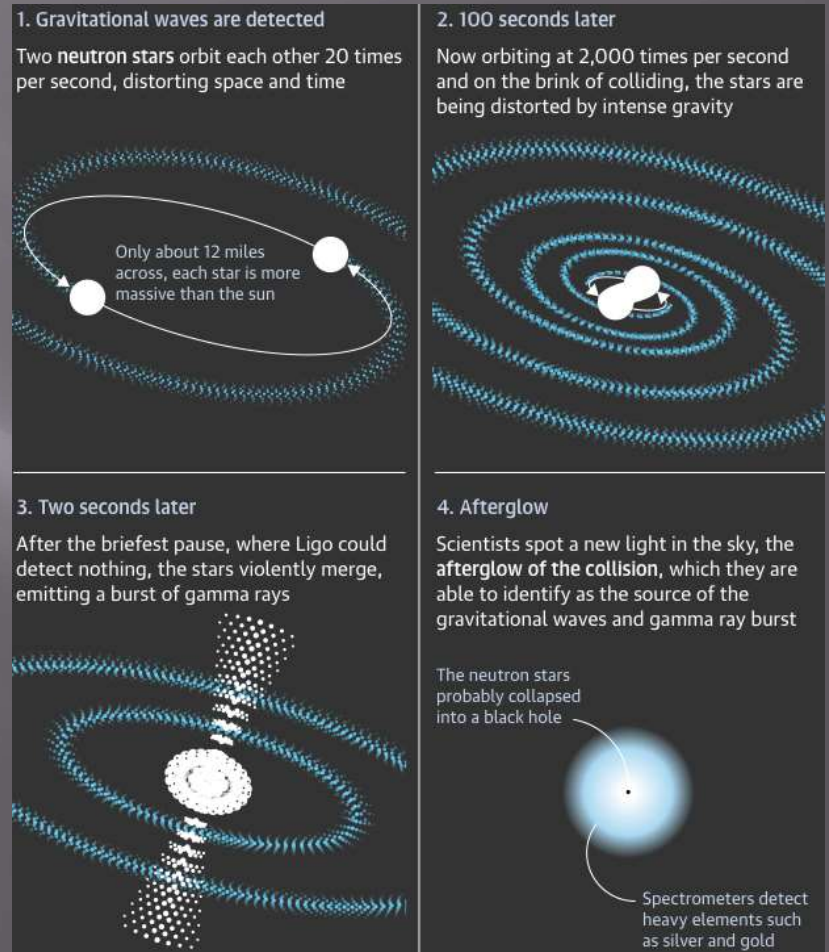

Debris (Au, Pt, Ur)

Steps in Merger

1. Waves detected
 - 200 miles apart
 - 20 rps
2. 100 sec. later
 - 1 mile apart
 - 2,000 rps
3. 2 sec after merger
 - Gamma ray burst – Ag, Au elements created
4. After glow – spectrometers detect Ag, Au

Guardian graphic – MIT, Caltech

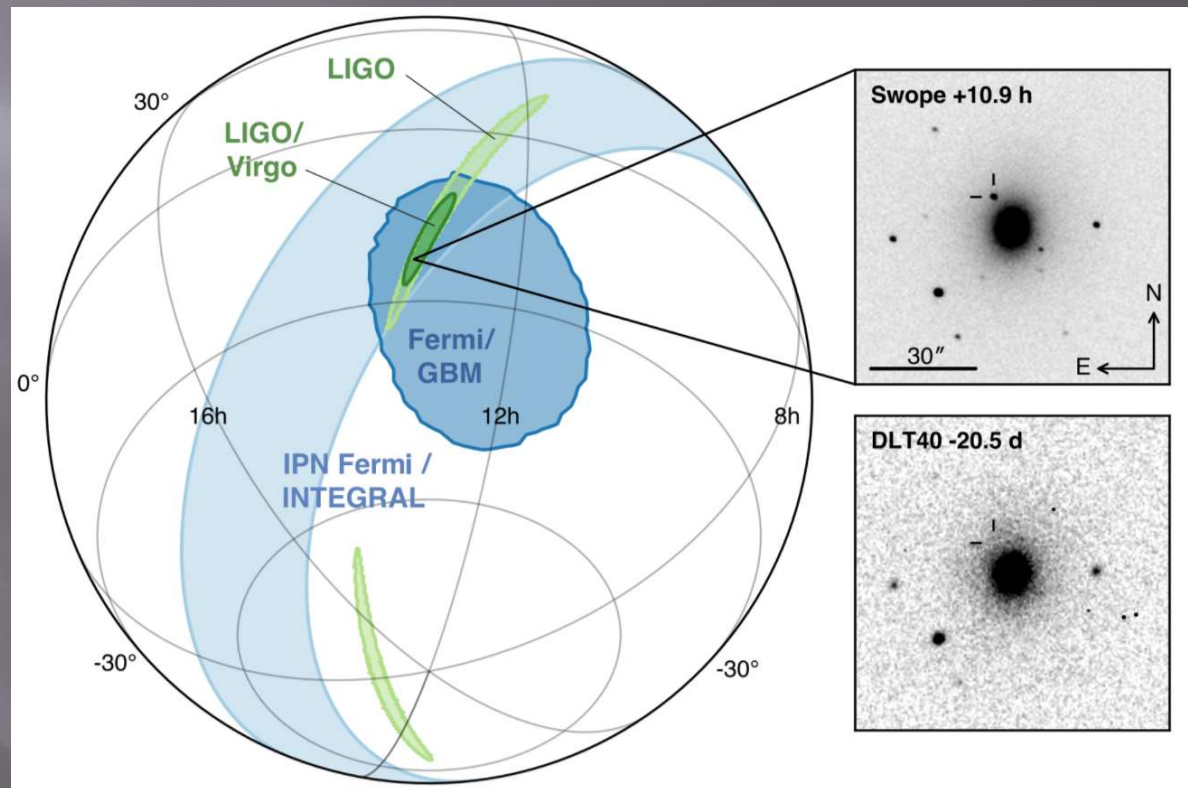

Sequence of Events

(August 17, 2018)

- ▣ First Gravity Waves (LIGO & VIRGO signal) → Merging dead stars
- ▣ Two seconds later Fermi Gamma-ray Space Telescope detected → Two second Gamma ray burst
- ▣ ~11 hours later optical telescopes → new source
 - 70 Ground and space based observatories

LIGO, VIRGO & Fermi Signals

- ▣ “Focus” LIGO by timing
- ▣ Fermi “sees” half sky

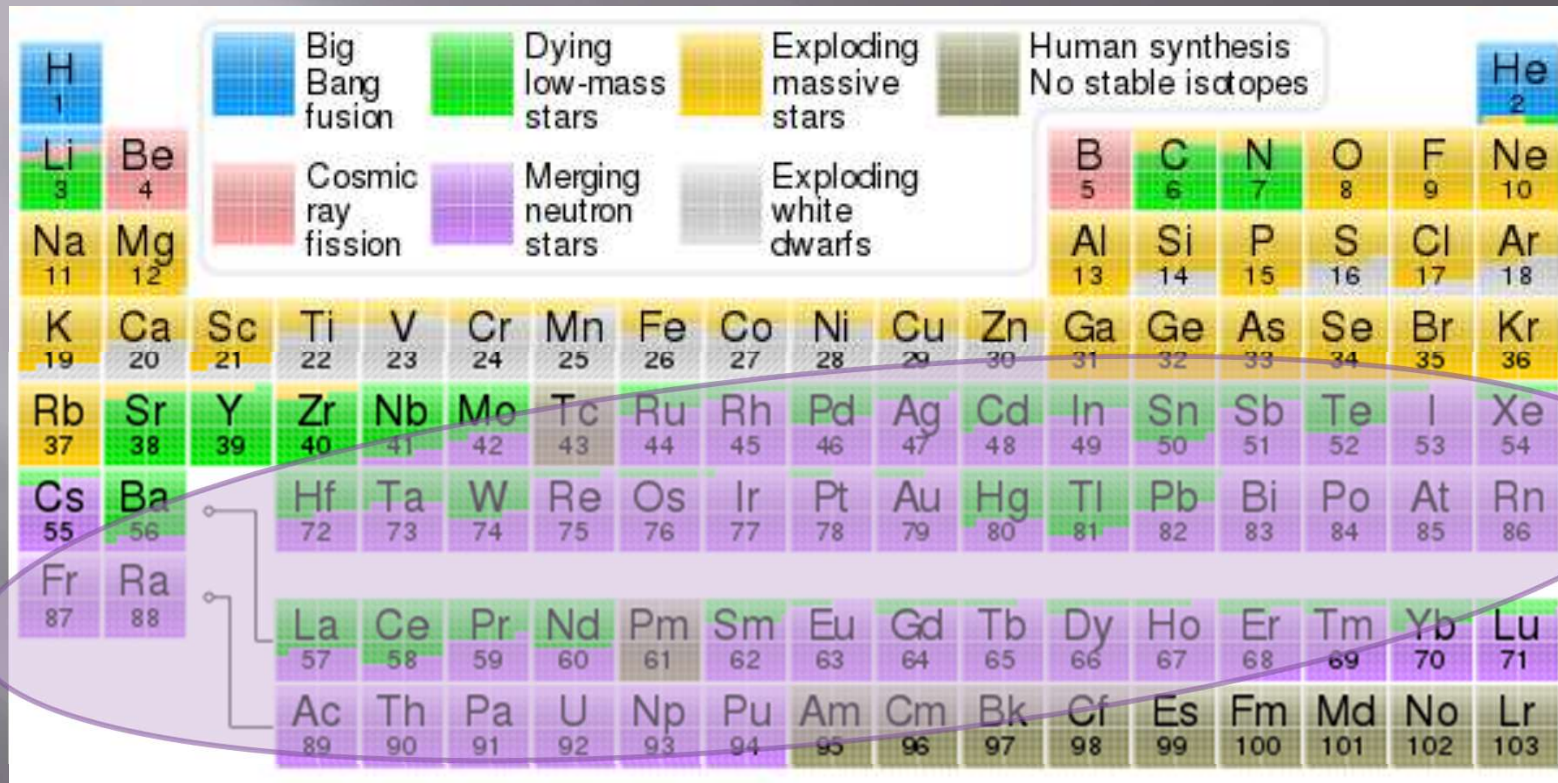

Artistic Gravity Waves

<https://www.nasa.gov/feature/goddard/2016/nsf-s-ligo-has-detected-gravitational-waves>

Nucleosynthesis

<https://en.wikipedia.org/wiki/Nucleosynthesis>

What we learned?

- ▣ Another validation of general relativity 1915
- ▣ Gravitational waves and EM waves (light, gamma rays and x-rays) travel at “C”.
- ▣ Validates neutron star merger production of heavy elements: gold, platinum, uranium
- ▣ Validates a source of short gamma ray bursts
- ▣ Measure expansion rate of universe using gravity waves
